

THE SURGICAL BEDDING CONCEPT – A NEW GENERATION

WITH
MICROSPACE
SYSTEM

A new definition of patient comfort –
the feeling of weightlessness in surgery

The product benefits of Vacuform® 2.0 surgical mattresses

- **Optimized pressure relief** (pressure test of ETH-HEMPA**)
- **Free of latex, PVC and softening agents** (biocompatible)
- **100% suitable for X-ray, MRI and CT use**
- **Image converter application possible during surgery**
- **In color-therapy, the color magenta next to green is described: "Having a general harmonizing effect on body and soul"**

Vacuform® 2.0 is provided with a new technology of a special coated PUR foil on the bottom side and makes them slip-proof. The coating of the upper side is

particularly soft, flexible and absolutely stable in form. Vacuform® 2.0 contains no latex, PVC and zero softening agents such as e. g. DEHP and **biocompatible**. The optimized pressure relief ensures the microcirculation needed by skin.

Vacuform® 2.0 is 100% **permeable to X-rays** as well as suitable for **MRI and CT use**, and they are equipped with a **plastic valve for one-handed operation**. Thanks to the new materials and technologies, Vacuform® 2.0 provides highest possible comfort for the patient while ensuring optimal working conditional for the surgical stuff and surgeon.

The innovative Vacuform® 2.0 MicroSpace System

MicroSpace filling in the evacuated state

Conventional filling in the evacuated state

Arrangement of the Vacuform® 2.0 MicroSpace balls without vacuum

Arrangement of the Vacuform® 2.0 MicroSpace balls under vacuum

Arrangement of conventional styrofoam balls without vacuum

- **Further optimized pressure relief**
- **"Weightless" feeling (like a water-bed) despite stable immobilization**
- **Surface nearly untextured**

The secret of perfected adaptation to the body by Vacuform® 2.0 surgical mattresses is microballs of styrofoam, which are stabilized by vacuum to give a lasting, completely supportive form. Only Vacuform® 2.0 contains since many years about the well proven and unique MicroSpace System an increases the feeling of physical comfort for the patient significantly compared to conventional fillings.

Reducing the diameter of the filler balls by a fifth enables significantly more precise adaptation of the surgical mattresses to the body.

* PUR = Polyurethane foil (biocompatible)

** Ask us for detailed measuring values to the edition pressure measurement.

Decubitus prophylaxis in the operating theatre

Particularly during **time-consuming** operations or with patients who are older and in poor condition, there is a risk of pressure points leading to acute decubital ulcers* and paresis (paralysis from nerve damage). The individual, **ergonomic body adaptation** of Vacuform®2.0 surgical mattresses effectively prevents such

damage. The **support pressure** of the patient is optimally distributed over the whole body and thus reduced to a minimum. The **microcirculation** needed by the skin is unaffected. The patient has a noticeable feeling of **comfort**, a feeling of lightness and warmth.

* Decubitus (bedsore, pressure sore) is damage to the skin and underlying tissue caused by pressure sustained for a longer period of time. It results in pain, isolation and reduced quality of life for the patient. Problems with decubitus can arise with as little as 10 to 20 minutes of increased pressure. Follow-up therapy for this results in Germany costs between 0.7 and 2 billion euros. (Pelka 1997)

Parts of the body at risk from decubitus

Safety on the operating table

- No slippage on the surgery table
- Safe immobilization
- Extreme surgery table inclination possible
- Fast, simple handling

The patient can be immobilized quickly and securely in any desired position. This gives the surgeon optimal access to the operation area and allows **safe handling** of the patient. Even the most extreme tilting of the surgery table does not change the defined position of the patient. The surgical positioning can be corrected at any time by relieving the vacuum, forming the surgical mattress to the new position of the patient and then evacuating the air again. Moreover, Vacuform®2.0 surgical mattresses enable **transport between hospitals** in a **defined surgical position**.

Examples of Vacuform®2.0 indications:

- Side position
- Semi-lateral position
- Supine position
- Seated / half-seated position
- Screw position
- Lithotomy position
- Laparoscopic positions
- Inter-clinical transport

Cost reduction with Vacuform® 2.0

- Prevention of sequelae
- Saves additional materials
- Long reusability
- Covers a wide range of surgeries
- Intra-operative illumination possible

Vacuform® 2.0 contributes to efficiency and leads to **considerable cost reduction** through fast, simple handling, prevention of sequelae such as decubitus and paresis,

saving of additional materials, fast cleaning and long reusability even with constant use.

The University Hospital Inselspital in Berne regarding the experience with Vacuform® surgical mattresses:

"The many years of work with the vacuum mattress have given us many advantages with respect to patient safety, quality of the individual positions, simplified handling, time savings and cost reduction by saving of additional bedding material. Once could maintain that the number of sequelae such as decubitus and paresis have decreased to insignificance with the use of Vacuform® surgical mattresses."

Pressure measurement:

The main reason for the occurrence of decubitus is the coaction of pressure, respectively shearing and time. How much pressure how long acting on the body, without causing damage is very different. To provide generally binding pressure and time specifications is not possible, as the

underlying disease, state of health, age, etc. have an influence. But fact is: less support pressure allows a longer pressure impact!

The support pressure measuring between the actual green Vacuform® and the new pink Vacuform® 2.0 pointed out optimized

support pressuring values under equal conditions and same period. The specialized vacuum system **Siliplus**, developed for mayor surgery's, shows the best value.

The expanded Vacuform® 2.0 selection of surgical mattresses

- Expanded standard selection
- Models for obese patients
- Custom product production

For all interventions requiring special positioning for surgery, the Vacuform® 2.0 product line offers surgical mattresses to satisfy all the relevant requirements for the indication. The **new, expanded Vacuform® 2.0 product line** includes

surgical mattresses for obese patients as well as a vacuum mattress as a contemporary alternative to a plaster bed. Furthermore, we are able to make nearly any **special size** you require.

The comprehensive offering of VACUFORM products helps you achieve almost any position and positioning for patients. The cushions can be used universally for the partial positioning of arms and legs, positioning the head or positioning of small children and babies.

The use as a simple pad or for general decubitus prophylaxis is also possible. The partial or whole fixed positioning during a CT, MRI or X-ray extends the field of application many times over.

Vacuum mattress for laparoscopic sigma resection

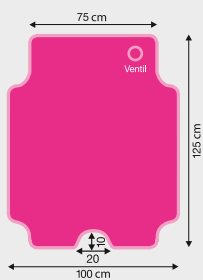

- A special positioning of the patient is needed for a laparoscopic sigma resection.
- Part No.: 3465315
- Size: 75/100 x 125 cm with section

The shape of this newly developed mattress in the VACUFORM 2.0 product series enablesthe positioning of the patient in a lithotomy position with elongated arms and an **extremely low position of the head**. For this purpose, the mattress has a widening from the height of the shoulders to the hands. They can be shaped at the shoulders so that the patient can be held in this position without shoulder support. The individual adjustment in the area of the shoulders

here prevents **paresis (paralysis) and nerve damage**. The underside of the mattress is equipped with a slip-proof special coating. In this extreme Trendelenburg position during a laparoscopic sigma resection, a non-slip film should additionally be positioned between the vacuum mattress and the operating table. This widening is not necessary for a perfect positioning of the head and pelvis. The mattress is also equipped with a section in the lower area.

Vacuform® 2.0 Siliplus – the optimised OR-Vacuummattress

- Further improved pressure release
- Accurately fitting and efficient
- Especially for long term operations

Vacuform® 2.0 **Siliplus** is a new, further optimised vacuum mattress from the Vacuform® 2.0 series. A system that is essential in the Operation Theatre for many years.

Vacuform® 2.0 **Siliplus** is a compound system with which a silicone gel mat is firmly connected with a vacuum cushion.

Because of the combination and the permanent compound of both components, which are already used as independent products in the OP, the pressure release becomes improved extensive. Especially while operations, e. g. in the oncological surgery, which can last sometimes longer than 20 hours, is this important to guaranty an optimum pressure release.

With Vacuform® 2.0 **Siliplus** a vacuum mattress which owns this determining

quality is now available. At the same time all the other advantages are preserved with a patient positioning with Vacuform® 2.0 mattresses or Vacuform® 2.0 cushions. This are mainly the security of the patient on the OP table also with extreme table inclinations, cost reduction by saving of time with positioning and cleaning, X-ray porosity, MRI- and CT suitability and many more.

The Vacuform® 2.0 surgical hood and head-triangular cushion

This specially developed hood encloses the entire head and fits the head ideally using the Vacuform® 2.0 principle. The valve for evacuating the air is on the outer left side of the hood; there is an opening on the outer right side which enables styrofoam balls to be added or removed to obtain an **ideal fit**. The hood can be used to immobilize the patient's head during computer tomography (CT), angiography, etc., because it is **permeable to X-rays**. For use in radiology, we offer a special plastic vacuum hand pump equipped with a non-magnetic brass rod.

collar circumference 61 cm # 34 64 700

Vacuform® 2.0 surgical hood, large
collar circumference 75 cm # 34 64 701

Particularly suitably for all OP positions in back position. The new head-triangular cushion make a back storage perceptibly more comfortably. By its triangular form and the cut out, the cervical area will be more supported. The pillow can be used singular or also in addition, adapted under the head. The application as a pillow by operations in the dentist's chair is recommendable.

The patient will be positioned in a comfortable situation with an optimally supported head. Depending of this the patient keeps calm and still by more well-being.

Vacuform® 2.0 QuickForm – with 6 chamber system

It has been proven time and again that there must be the possibility to be able to reposition the vacuum mattress so that it creates the optimal individual position for every patient.

Due to this, a fixed position of the filling through a multiple chamber system in the vacuum mattress is not always recommended. There are however surgeries that do not last long and during these, the patient for example will be positioned in a simple supine position. Here it will often suffice due to the short duration of the surgery to forego the use of the vacuum mattress, although this will be more comfortable for the patient in any case. Even brief surgeries can cause a bad physical condition in patients (cachectic) in Decubitus.

Advantages of the 6 chamber mattress:

- Immediate readiness. The filling is optimally spaced.
- Preparation that saves time and money.
- Unrestricted use of all advantages of VACUFORM 2.0: optimal adjustment, decubitus prophylaxis, safety, heat storage, prevents nerve damage, optimal access to the operation area etc.

The Vacuform® 2.0 surgical sheet

The Vacuform® 2.0 surgical sheet is equipped with 8 handles for turning and repositioning the patient. Its outstanding features include high durability, silky comfort and a long service life. The material consists of three layers:

1. A soft velour surface.
2. A extremely absorbent Triton™ layer able to handle up to 1.25 liters of liquid per m².

3. A layer impermeable to liquid to protect the surgical mattress and operating table. The composition of the fibers used effectively prevents rewetting, so the Vacuform® 2.0 surgical sheet essentially always feels dry.
